

Tutorial 3(7/8/26)

1. A supermarket wants to calculate the total bill for a customer. (**NOTE: Implement using if statement, for loop, Array**)

Task

Write a Java program to:

- Read the prices of five products.
- Store them in an array.
- Calculate the total bill.
- If the total bill exceeds ₹5000, display "**Discount Applicable**"; otherwise display "**No Discount**".

Sample Input

1200

1500

800

1000

900

Expected Output

Total Bill : 5400

Discount Applicable

2. A school records attendance for seven days. (**NOTE: Implement using if statement, for loop, Array**)

Task

Write a Java program to:

- Store attendance values (1 for Present, 0 for Absent) in an array.
- Count the total number of present days.
- If attendance is greater than or equal to 75%, print "**Eligible for Exam**"; otherwise print "**Not Eligible**".

3. A company wants to store employee details using object-oriented programming.

Task

Write a Java program to:

- Create an Employee class.
- Use a **constructor** to initialize Employee ID, Employee Name, and Salary.
- Display all employee details.

Sample Input

Employee ID : 101

Employee Name : Rahul

Salary : 45000

Expected Output

Employee ID : 101

Employee Name : Rahul

Salary : 45000

4. A car showroom allows customers to register in different ways:

- Without entering any details.
- By entering only the model name.
- By entering both model name and price.

Task

Write a Java program using **constructor overloading** to support all three registration methods and display the car details.

5. A geometry application should calculate the area of different shapes.**(Method Overloading)**

Task

Create overloaded methods to calculate:

- Area of a square
- Area of a rectangle
- Area of a circle

Display the calculated area.
