

Tutorial Questions

Date:24/7/26

1. College is developing a student information system. Write a Java program to display a student's name, register number, department, year of study, and college name in a neatly formatted manner.
2. A supermarket cashier needs to calculate the total, difference (discount comparison), product, quotient, and remainder of the prices of two products. Write a Java program to perform these arithmetic operations and display the results.
3. The Physical Education Department wants to calculate the area of a rectangular playground before marking it for the annual sports meet. Write a Java program to calculate the area using the given length and breadth
4. Two students accidentally exchanged their roll numbers in the attendance register. Write a Java program to swap the two roll numbers:
 - (a) Using a temporary variable.
 - (b) Without using a temporary variable.
5. Three students participated in a coding competition. Their scores are given. Write a Java program to find the student with the highest score.
6. A movie theatre has separate counters for even-numbered and odd-numbered seat numbers. Write a Java program to determine whether the given seat number is even or odd.
7. A class teacher wants to identify whether a student has passed the internal assessment. The passing mark is **50**. Write a Java program to accept the student's marks and display "**Pass**" if the marks are 50 or above; otherwise, display "**Fail**".

8. A company wants to calculate an employee's monthly salary. Write a Java program to accept the employee's **basic salary** and **allowance**, then calculate and display the **total salary**.
